Contents

What is LATEX?

- $\tau\epsilon\chi$ (TEX) was developed between 1977 and 1986 by Donald E. Knuth.
- LATEX is an interface with helpful macros for the TEX system. It was written by Leslie Lamport (= **La**mport **TEX**).
- LATEX works with **markup tagging conventions** – similar to HTML – to
    - define the structure of the document (e.g. chapters and sections),
    - for typographic marking (e.g. bold and italics),
    - for cross-references (e.g. citations)

WYSIWYG vs. WYGIWYN

- *MS Word* or *Libre Office*: **WYSIWYG** (*what-you-see-is-what-you-get*)

<blockquote>

This is a headline

This word is **bold** and this one is in *italics*.

</blockquote>

- LATEX: **WYGIWYN** or **WYGIWYM** (*what-you-get-is-what-you-need*/*mean*)

<blockquote>

\section{**This is a headline**}

This word is **\textbf**{bold} and this one is in **\textit**{italics}.

</blockquote>

Overleaf

1. Go to: https://www.overleaf.com
   Overleaf is an online LATEX editor.
2. **Register** with your email address and create a new blank project.
   Your project is not completely empty. Overleaf provides already some
   information. Later, we are going to change this information.
3. **Compile** your project: Click on the green button *Recompile*.

You will find the tasks for our course here:
https://github.com/langsci/latex4linguists/blob/master/1-1.md

Document structure 1

A LATEX document consists of (at least) two parts: **preamble** and **body**.

LATEX preamble

part of the document where **global characteristics** of the document are specified.

LATEX body

part of the document where **local characteristics** of the document are specified
and where you write your document.

Exercise

- Insert the following lines in your `.tex` file and compile.

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% Compile: XeLaTeX BibTeX XeLaTeX XeLaTeX
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

\documentclass{scrartcl}

%%%%%%%%%%%%%%%PACKAGES%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%COMMANDS%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%META DATA%%%%%%%%%%%%%%%

%%%%%%%%%%%%%END PREAMBLE%%%%%%%%%%%%%

%%%%%%%%%%%BEGIN DOCUMENT%%%%%%%%%%%

\begin{document}
This is my first \LaTeX\ file.
\end{document}

%%%%%%%%%%%%END DOCUMENT%%%%%%%%%%%%
```

- Write something after the `\end{document}` command and compile again.

Document class

Global parameters of the layout can be specified in the `documentclass` command. The most commonly used classes are:

- `book` for books
- `article` for articles, without chapters, only with sections
- `beamer` for presentations, without chapters, only with sections

Document class

Global parameters of the layout can be specified in the `documentclass` command. The most commonly used classes are:

- `book` for books
- `article` for articles, without chapters, only with sections
- `beamer` for presentations, without chapters, only with sections

Variations of these classes (not in American formats) are provided by the `KOMA-Script`:

- `scrbook` for books
- `scrartcl` for articles, without chapters, only with sections

You can specify **options** in your `documentclass` command.

- **Font size** as default: `10pt`, `11pt`, `12pt`
  Default → `10pt`
- **Paper format**: `letterpaper`, `a4paper`
  Default → `letterpaper`

Specification of paper format in `KOMA-Script` classes: `paper=a4`, `paper=letter`

Exercise

- Specify the following options for your document `.tex` file and compile.

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% Compile: XeLaTeX BibTeX XeLaTeX XeLaTeX
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

\documentclass[10pt, paper=a4, abstracton]{scrartcl}

%%%%%%%%%%%%%%%%PACKAGES%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%%COMMANDS%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%%META DATA%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%END PREAMBLE%%%%%%%%%%%%%%

%%%%%%%%%%%%%BEGIN DOCUMENT%%%%%%%%%%%%%

\begin{document}

This is my first \LaTeX\ file.

\end{document}

%%%%%%%%%%%%%END DOCUMENT%%%%%%%%%%%%%
```

Commands

In LATEX, there are normally **3 types of commands**:

- **declarations:** backslash + command name
  The scope of the command can be defined by an environment or with curly brackets.

```
\declaration ...
{\declaration ...} outside of scope
```

```
{\Huge Hello world!} outside of scope
```

Commands

In LATEX, there are normally **3 types of commands**:

- **declarations:** backslash + command name
  The scope of the command can be defined by an environment or with curly brackets.

```
\declaration ...                          {\Huge Hello world!} outside of scope
{\declaration ...} outside of scope
```

- **simple commands:** backslash + command name + optional arguments (square brackets) + obligatory arguments (curly brackets)

```
\name[optional]{obligatory}               \textit{Text in italics}
```

Commands

In LATEX, there are normally **3 types of commands**:

- **declarations:** backslash + command name
  The scope of the command can be defined by an environment or with curly brackets.

```
\declaration ...
{\declaration ...} outside of scope
```

```
{\Huge Hello world!} outside of scope
```

- **simple commands:** backslash + command name + optional arguments (square brackets) + obligatory arguments (curly brackets)

```
\name[optional]{obligatory}
```

```
\textit{Text in italics}
```

- **environments:** begin + end command.
  Command applies between begin and end.

```
\begin{environment}[optional]
...
\end{environment}
```

```
\begin{center}
Hello world!
\end{center}
```

Meta data

Specifying the **meta data** of your document **in the preamble**:

```
\author{first name last name \and first name last name}
\title{my title}
\subtitle{my subtitle}
\date{14th Februar 2019}
```

- Other options for date: `\date{\today}`, `\date{}`
  Default → `\date{\today}`

Use the command `\maketitle` after `\begin{document}` to include this information in your output.

Exercise

Specify the meta data in your document with two authors, use the `\maketitle` command, and try different commands for date.

```
\documentclass[10pt, paper=a4, abstracton]{scrartcl}

%%%%%%%%%%%%%%PACKAGES%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%COMMANDS%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%META DATA%%%%%%%%%%%%%%
\author{Sebastian Nordhoff \and Antonio Machicao y Priemer}
\title{\LaTeX\ for Linguists}
\subtitle{My first \TeX\ document}
\date{\today}

%%%%%%%%%%%%END PREAMBLE%%%%%%%%%%%%%

%%%%%%%%%%BEGIN DOCUMENT%%%%%%%%%%%%%

\begin{document}

\maketitle
```

Headlines

Commands for the structure of your text:

- `\part{title}`   (only in `book`/`scrbook` and `report`/`scrreprt`)
- `\chapter{title}`   (only in `book`/`scrbook` and `report`/`scrreprt`)
- `\section{title}`
- `\subsection{title}`
- `\subsubsection{title}`
- `\paragraph{title}`
- `\subparagraph{title}`

Headlines

Commands for the structure of your text:

- `\part{title}`   (only in `book`/`scrbook` and `report`/`scrreprt`)
- `\chapter{title}`   (only in `book`/`scrbook` and `report`/`scrreprt`)
- `\section{title}`
- `\subsection{title}`
- `\subsubsection{title}`
- `\paragraph{title}`
- `\subparagraph{title}`

These commands can be used with an option, e.g.
`\section[short title]{long title}`

The text in the **option** – when used – appears in the **table of contents** and in the **headers**, otherwise only the text in the **argument** is used.

Cross references 1

To work with cross references, you need two things:

1. a `label` with an ID: `\label{ID}`
   The ID must be **unique** for the labelled element in your document.

2. a `reference`: `\ref{ID}`
   With the `ref` command, LATEX will take the **number of the element labelled** with the given ID and use it for cross references.

Cross references 1

To work with cross references, you need two things:

1. a `label` with an ID: `\label{ID}`
   The ID must be **unique** for the labelled element in your document.

2. a `reference`: `\ref{ID}`
   With the `ref` command, LATEX will take the **number of the element labelled** with the given ID and use it for cross references.

The `label` command must **follow** (if possible: immediately) the element it is labelling.

The command `\pageref{ID}` will give you the **page** on which the labelled element appears.

```
\section{Introduction}
\label{sec:Intro}

To see how cross referencing works, take a look at Section \ref{sec:Intro}
which is on page \pageref{sec:Intro}
```

For long works, it is **useful** to have **prefixes**. They help you to find your references faster.

`sec` for sections, subsections, . . .

`fig` for figures

`tab` for tables

`it` for numbered items in lists

`eq` for equations

`fn` for footnotes

```
\section{Introduction}
\label{sec:Intro}

To see how cross referencing works, take a look at Section \ref{sec:Intro}
which is on page \pageref{sec:Intro}
```

Paragraphs & line breaks

- new **paragraph**: twice ⟨ENTER⟩ (↵) key
- **line** break: `\newline` or `\\` cause a line break without ending the paragraph.
- new **page**: `\newpage` or `\clearpage`
- `\noindent` **prevents** the **indentation** after a line break.

Table of contents

To **generate** a **table of contents** just include the following command in the body of your document at the position where you want the toc to appear.

LATEX generates your toc taking the **information from your structuring commands** (e.g. `\section[short title]{title}`).

`\tableofcontents`

%%%%%%%%%%BEGIN DOCUMENT%%%%%%%%%%%%

\begin{document}

\maketitle

\tableofcontents

\section[Introduction]{A short introduction}

This is a sample text. The only purpose of this text is to show how to work with \LaTeX . It is not necessary that this text has any meaning. It should only show some properties of the system we are using.

\subsection{A note on the data}

This is a sample text. The only purpose of this text is to show how to work with \LaTeX . It is not necessary that this text has any meaning. It should only show some properties of the system we are using.

\end{document}

%%%%%%%%%%%%END DOCUMENT%%%%%%%%%%%%

Footnotes

To generate a footnote, use the following command at the position where the **footnote index** should appear.

```
\footnote{content of the footnote}
```

Example

```
This is a sample text. The only purpose of this text\footnote{A text
(literary theory) is any object that can be read.} is to show how
to work with footnotes in \LaTeX .\footnote{\LaTeX\ is a document preparation
system.}
```

Exercise

Go to
https://github.com/langsci/latex4linguists/blob/master/1-1.md
and follow the instructions of the **first four blocks** in your .tex file.

Characters & spaces

- The following characters can be used without problems:

  ```
  a...z A...Z 0...9
  . , : ; ? ! ' ' " ( ) + - * =
  ```

Characters & spaces

- The following characters can be used without problems:

```
a...z A...Z 0...9
. , : ; ? ! ' ' " ( ) + - * =
```

- With XeLATEX, you can write **accents** and **umlauts** without further commands. Another option is to use **commands**:

```
\"A \"O \"a \"o \'a \'o \ss{} \^u \~n

\"{A} {\"O} {\ss}
```

  (1) Ä Ö ä ö á ò ß û ñ
       Ä Ö ß

Characters & spaces

- The following characters can be used without problems:

```
a...z A...Z 0...9
. , : ; ? ! ' ' " ( ) + - * =
```

- With XeLATEX, you can write **accents** and **umlauts** without further commands. Another option is to use **commands**:

```
\"A \"O \"a \"o \'a \'o \ss{} \^u \~n

\"{A} {\"O} {\ss}
```

  (1) Ä Ö ä ö á ò ß û ñ
       Ä Ö ß

- The following characters have a **special meaning** in TEX.
  You must **escape** their function to use them. (It depends on your compiler e.g. XeLATEX vs. PDFLATEX)

```
# $ & _ { } \ < > | ~ ^ [ ] %
```

- escaping with **backslash**

```
\#  \$  \&  \_  \{  \}  \%
```

(2)   # $ & _ { } %

- escaping with **backslash**

```
\#  \$  \&  \_  \{  \}  \%
```

    (2)   # $ & _ { } %

- escaping with **macros** or **math mode**

```
\textbackslash \textasciitilde \textasciicircum
\textgreater $>$ \textless $<$ \textbar $\vert$ $|$
```

    (3)   \ ~ ^ > > < < | | |

- escaping with **backslash**

```
\# \$ \& \_ \{ \} \%
```

(2)   # $ & _ { } %

- escaping with **macros** or **math mode**

```
\textbackslash \textasciitilde \textasciicircum
\textgreater $>$ \textless $<$ \textbar $\vert$ $|$
```

(3)   \ ~ ^ > > < < | | |

- Sometimes **angled brackets** <> can be used in XeLATEX without further commands.
- **Square brackets** [ ] can be used in plain text, but they can also mark the **option** of a command (e.g. in `\section[short title]{title}`).
  In this case use `\[ \]` for the brackets.

More on special characters:
https://en.wikibooks.org/wiki/LaTeX/Special_Characters

Space & line break

LATEX has a special treatment of **spaces** and **line breaks** to avoid typographic errors:

- **no difference** between a **blank** and a **tab**
- **Consecutive blanks** are treated as only one blank.
- A **blank** at the **beginning of a line** is ignored.
- One **line break** (1x ⟨ENTER⟩) is interpreted as a blank.
- One **empty line** (2x ⟨ENTER⟩) is interpreted as the end of a paragraph.
- **More than one empty line** is interpreted as one empty line.

Example

```
    This is       a sample            text with too   many spaces. Here, I use one
line break.
This is a sample text. Now, I use one blank line.

This is a sample text. Now, I use 3 blank lines.

This is a sample text.
```

Example

```
   This is        a sample              text with too  many spaces. Here, I use one
line break.
This is a sample text. Now, I use one blank line.

This is a sample text. Now, I use 3 blank lines.

This is a sample text.
```

This is a sample text with too many spaces. Here, I use one line break. This is a sample text. Now, I use one blank line.
This is a sample text. Now, I use 3 blank lines.
This is a sample text.

Commenting out

In LATEX, text following the character **%** in a line will be **ignored**.

- **hiding code/text**, without deleting it;
- **finding errors** in sections;
- **avoiding blanks** and **empty lines** in a long input line;
- **writing comments** without seeing it in the output.

```
This is a sample text. %These are just notes
%Here is a special characters and a command: & \small

A comment can divide a word:
Rindfleischetikettierungs% 5 morphemes
überwachungsaufgaben% 6 morphemes
übertragungsgesetz.
```

This is a sample text.
A comment can divide a word: Rindfleischetikettierungsüberwachungsaufgaben-übertragungsgesetz.

Text formatting

```
\textbf{bold}
\textit{italics}
\textsl{slanted}
\emph{emphasized}
{\it test \textup{upright} test}
\texttt{typewriter}
\textsc{small caps}
ex\textsuperscript{up}
ex\textsubscript{down}
```

bold
italics
slanted
emphasized
test upright *test*
typewriter
SMALL CAPS
ex^{up}
ex$_{down}$

Some of these commands can be also used as **declarations**.

```
{\tiny tiny}
{\scriptsize scsize}
{\footnotesize fnsize}
{\small small}
{\normalsize normal}
{\large large}
{\Large Large}
{\LARGE LARGE}
{\huge huge}
{\Huge Huge}
```

tiny

scsize

fnsize

small

normal

large

Large

LARGE

huge

Huge

The commands for font size can be used as **declarations** or as **environments**.

Exercise

Go to
https://github.com/langsci/latex4linguists/blob/master/1-1.md
and follow the instructions of the **fifth block** in your `.tex` file.

Test further commands!

Text environments

You will normally need the following text environments:

- quotations,
- lists,
- abstracts,
- . . .

Quotations

- In LaTeX there are two environments for quotations `quote` and `quotation`.
- Both show a different output dependent on the document class (e.g. `beamer` vs. `article`).

```
This is a sentence before the \texttt{quote} environment.
\begin{quote}
Furthermore, each actual ''language'' will incorporate a periphery of
borrowings, historical residues, inventions, and so on, which we can hardly
expect to -- and indeed would not want to -- incorporate within a principled
theory of UG. [\dots]

Viewed against the reality of what a particular person may have inside his head,
core grammar is an idealization. \hfill (Chomsky,~1981:~8)
\end{quote}
This is a sentence after the \texttt{quote} environment.
```

List environments

LATEX has 3 pre-defined and 1 general list environments:

- itemize,
- enumerate,
- description,
- list.

List environments

LATEX has 3 pre-defined and 1 general list environments:

- `itemize`,
- `enumerate`,
- `description`,
- `list`.

Every environment begins with the `\begin{ }` and ends with the `\end{ }` command. Each point on the list begins with `\item`.

```
\begin{itemize}
\item syntax
\item semantics

\begin{itemize}
\item lexical semantics
\item propositional semantics
\end{itemize}

\item morphology
\end{itemize}
```

- syntax
- semantics
    - lexical semantics
    - propositional semantics
- morphology

The `description` list can be used for terms with their definitions.

```
\begin{description}
\item[Morpheme:] smallest grammatical unit in a language bearing a meaning

\begin{description}
\item[Allomorph:] phonetic variant of a morpheme
\end{description}

\item[Phoneme:] systematic unit of sound (or gesture in the case of sign
languages, see chereme) that distinguish one word from another in a particular
language
\end{description}
```

> **Morpheme:** smallest grammatical unit in a language bearing a meaning
>
> **Allomorph:** phonetic variant of a morpheme
>
> **Phoneme:** systematic unit of sound (or gesture in the case of sign languages, see chereme) that distinguish one word from another in a particular language

Combining lists

Lists can be **combined** with and **embedded** in other list types.

```
\begin{description}
\item[Morpheme:] smallest grammatical
unit in a language bearing a meaning

\begin{itemize}
\item minimal unit in morphology
\item subtypes:

\begin{enumerate}
\item roots
\item prefixes
\item suffixes
\item \dots
\end{enumerate}

\end{itemize}

\end{description}
```

Morpheme: smallest grammatical
unit in a language
bearing a meaning

- minimal unit in
  morphology
- subtypes:
  1. roots
  2. prefixes
  3. suffixes
  4. . . .

Customizing lists

Bullet points can be customized with an **optional parameter**.

```
\begin{itemize}
\item standard symbol
\item[+] customized
\item[--] customized
\item[--] customized
\end{itemize}
```

- standard symbol
+ customized
– customized
– customized

```
\begin{enumerate}
\item standard symbol
\item[+] customized
\item[+] customized
\item[--] customized
\item standard symbol
\end{enumerate}
```

1 standard symbol
+ customized
+ customized
– customized
2 standard symbol

Abstract

For automatic abstracts, use the option `abstracton` in the `\documentclass` command.

```
\begin{abstract}
An abstract is a brief summary of a research article, thesis, or any in-depth
analysis of a particular subject and is often used to help the reader quickly
ascertain the paper's purpose.\par
When used, an abstract always appears at the beginning of a manuscript, acting
as the point-of-entry for any given academic paper.
\end{abstract}
```

Abstract

An abstract is a brief summary of a research article, thesis, or any in-depth analysis of a particular subject and is often used to help the reader quickly ascertain the paper's purpose.
When used, an abstract always appears at the beginning of a manuscript, acting as the point-of-entry for any given academic paper.

Exercise

Go to
https://github.com/langsci/latex4linguists/blob/master/1-1.md
and follow the instructions of the **blocks 6–8** in your .tex file.

Test further commands!

Loading Packages

- The functions LATEX offers are restricted. Most **extra features** you will need come with **packages** that you can load in your TEX document.
- Packages must be loaded in the **preamble** of your document.

```
\usepackage[parameter1, parameter2]{package name}
```

Loading Packages

- The functions LATEX offers are restricted. Most **extra features** you will need come with **packages** that you can load in your TEX document.
- Packages must be loaded in the **preamble** of your document.

```
\usepackage[parameter1, parameter2]{package name}
```

- Normally, LATEX packages are already **pre-installed** in your TEX distribution (e.g. MiKTeX).
- Almost every other package (with manual) can be **downloaded** from CTAN – The Comprehensive TEX Archive Network (http://www.ctan.org/)
- With the command usepackage your TEX distribution loads the package – or **downloads it automatically** if necessary.

These packages can be useful:

- Language package: `babel`   `\usepackage[ngerman, english]{babel}`
- Font: `libertine`   `\usepackage{libertine}`
- Blind text: `lipsum` or `blindtext`   `\usepackage{blindtext}`
- URLs: `url`   `\usepackage{url}`
- Links (e.g. for cross references): `hyperref`
       `\usepackage[bookmarksnumbered, hidelinks]{hyperref}`

Sometimes the **order** in that packages have been installed can affect the compilation (e.g. `gb4e` and `forest`).

Also, not all packages are **compatible** with each other or with your compiler (XeLATEX vs. PDFLATEX).

Exercise

Go to
https://github.com/langsci/latex4linguists/blob/master/1-1.md
and follow the instructions of the **blocks 9–11** in your `.tex` file.

Test further commands!
